

LEASHED AGENT

EVERY PAYMENT ON-CHAIN

An AI worker you can fund with a QR code, audit on-chain, and fire with a button.

TOKEN2049 Origins Hackathon · 6–8 Oct 2026 · Marina Bay Sands
Team Leashed — main track + Cardano · Chainlink CRE · NOWNodes

the poster on slide 5 was bought by the agent · everything recorded during the 36h sprint

AI agents already spend money. Nobody is holding the leash.

No enforced budgets

x402 agents pay per call with whatever the key holds — spending caps live in app code, not the chain

No receipts

once the API call returns, the payment evidence is scattered across explorers, if it exists at all

No independent audit

the agent's operator grades its own homework — there is no third party vouching for the books

No fiat on-ramp

a Thai shop owner cannot top up an agent from a bank app today

Source: x402 Foundation stats — 75.4M txs but only \$24.2M volume in 30 days (Aug 2026): micropayments dominate, oversight does not exist.

**THE TRUST LAYER IS
MISSING**

The Leashed Agent — a pay-as-you-go worker on a chain-enforced leash

The agent is a Thai SME marketing worker: it pays an LLM for copy (0.2 THCFI) and an image model for the finished Thai-text poster (1.5 THCFI) — per call, per use.

LEASH

Spending cap set by the human and enforced by the ThaiFi chain itself (AccountKeychain, TIP-1011). Revocation is instant and on-chain.

RECEIPTS

Every payment on every rail becomes one ledger entry — amount, purpose, explorer link — readable like a bank passbook.

AUDIT

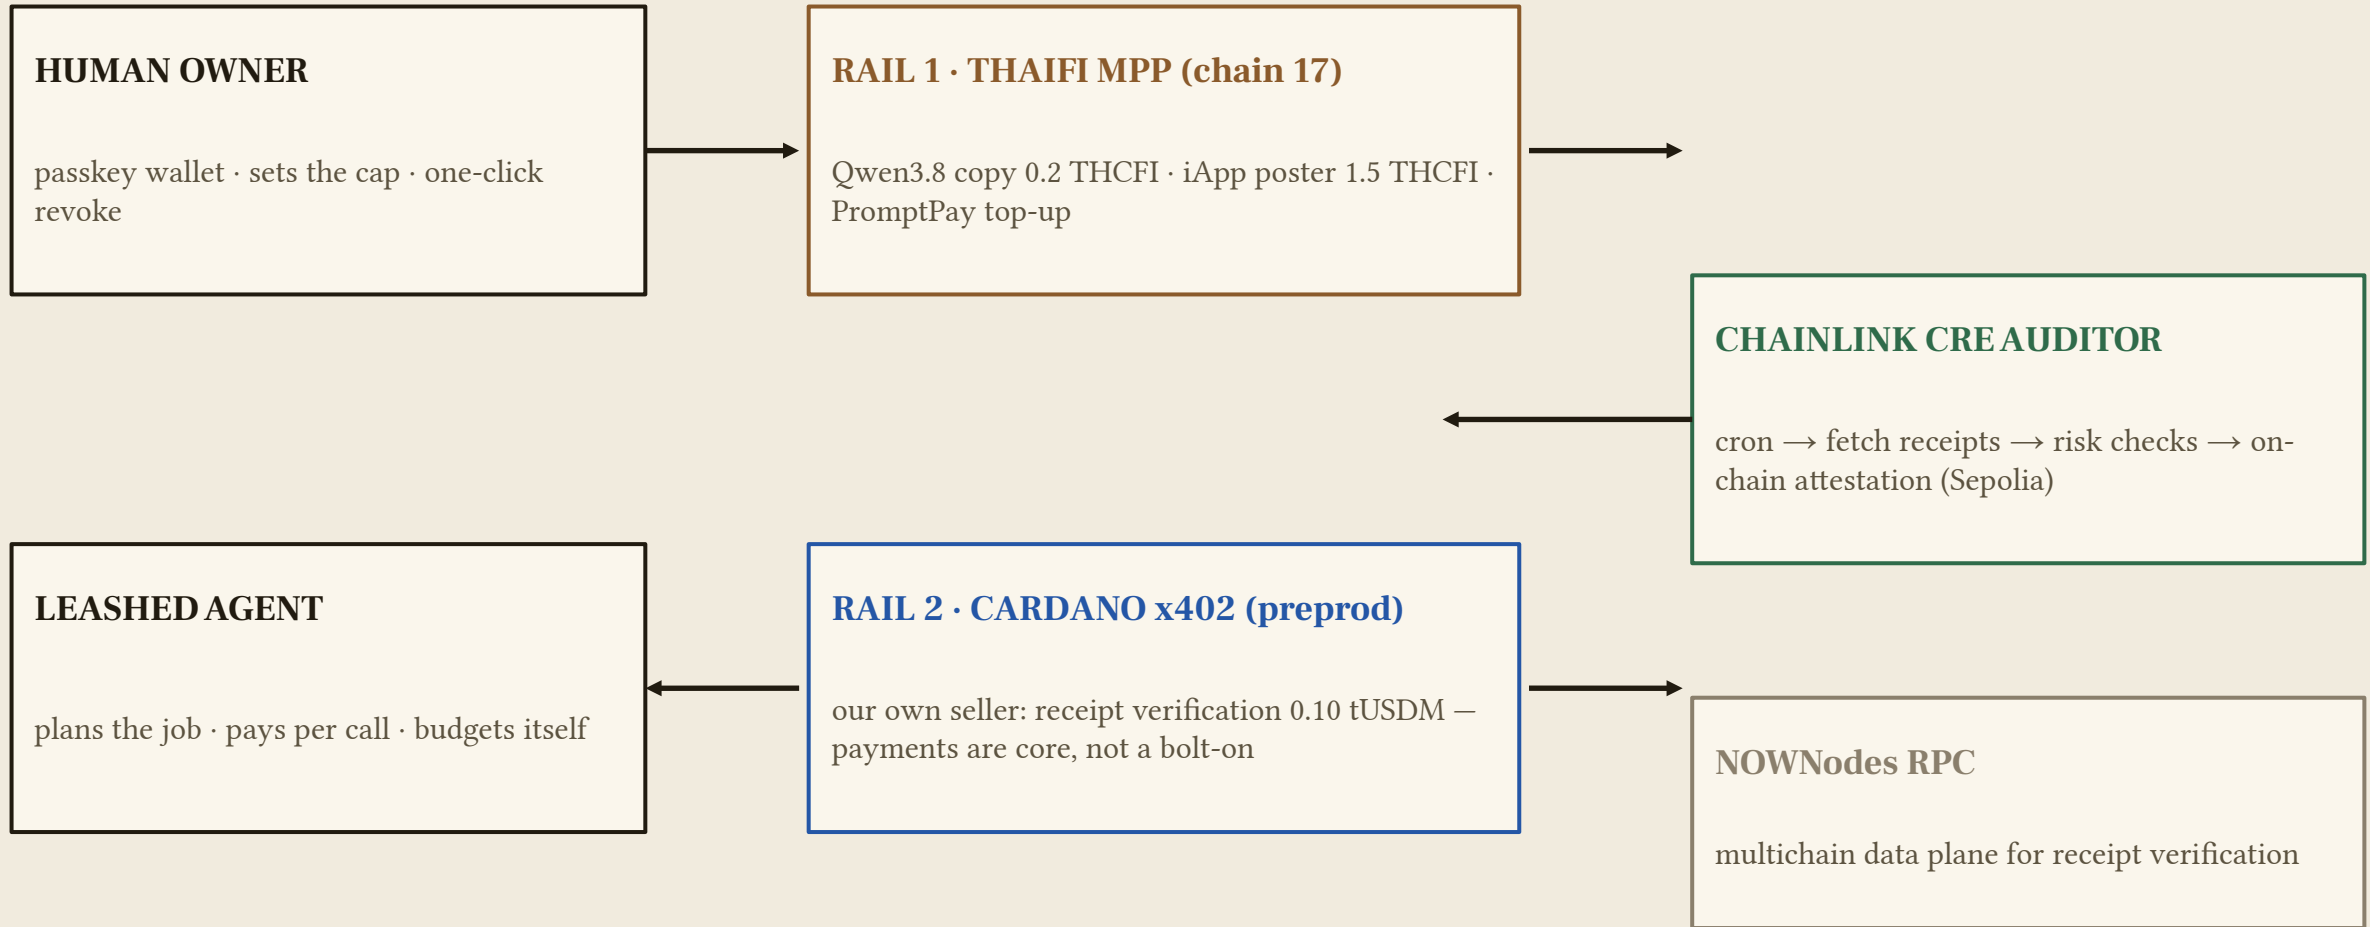

A Chainlink CRE workflow re-checks the whole ledger and attests the verdict on-chain. Neither the agent nor we can forge it.

FUNDING

Budget runs low → the agent shows a PromptPay QR → 1 THB = 1 THCFI, straight from any Thai banking app.

IT ALREADY WORKS

One agent, two payment rails, one independent auditor

Solid arrows = real, explorer-linked calls made during the sprint.

It ran. During the hackathon. On real rails.

Leash enforcement	AccountKeychain · TIP-1011	4,998.5 / 5,000 THCFI	on-chain limit decremented by the chain itself — incl. gas

Ledger + policy engine: 10 unit tests · seller: live at :4020 · audit re-runnable: pnpm probe / scripts/demo.sh

One product, four submissions — every integration is core

MAIN · \$100K AWS

The whole product: two-rail agent + passbook oversight + CRE audit.
Themes: AI x Crypto · Payments · Consumer.

CARDANO · \$27.5K

Payments are Cardano-native: x402 preprod tUSDM, our own seller endpoint, TS-only SDK path — 0.10 tUSDM changed hands.

CHAINLINK CRE · \$10K

The auditor IS a CRE workflow: HTTP fetch + risk logic + EVM write, proven by cre workflow simulate.

NOWNODES · €6.5K

The auditor's RPC data plane reads EVM receipt state through NOWNodes — architectural, not decorative.

Partner integrations are core functionality on every track — the rules disqualify bolt-ons, so each leg earns its keep.

Built for the rubric, in 30 hours, by humans with a leash of our own

PRE-BUILT ≠ SUBMITTED

Functionality 30%

Two paid journeys ran end-to-end with explorer links; top-up, revoke and auditor flows all execute.

Technical 25%

On-chain limit enforcement (TIP-1011) · x402 seller + payer · MPP memo-bound charges · CRE orchestration.

Innovation 20%

The trust layer: leash + receipts + independent audit + fiat on-ramp — the lane comparables left empty.

Usefulness 15%

A noodle shop owner in Bangkok is the persona. 1 THB = 1 THCFI funding needs no exchange account.

Demo 10%

Recording embedded, judgment-proof: every claim is a clickable transaction.

Eligibility: submitted code written in-sprint. ThaiFi wallet/CLI used as public tooling (npm), affiliation disclosed in the README.

Fund it with a QR.
Leash it on-chain.
Audit it with Chainlink.
